tom arnall wrote:

i attempted the distr-upgrade and after i rebooted did:

```
kloro@debian:~$ uname -r  
2.6.16.4
```

so i did the distr-upgrade again. following is the session output. '31 not fully installed or removed.' is where it gets interesting:

```
kloro@debian:~$ sudo apt-get dist-upgrade
```

It was doomed from the start. apt-get does not have the intelligence, as do the apt front ends, essential for all but the most trivial upgrades. Of those I can only vouch for personal favorite, dselect.

judging from the menu for dselect, there does not seem to be a way to do a dist-upgrade, only install like with 'apt-get install'.

That's correct. I never explicitly upgraded from one distribution to another with dselect. I merely pointed to the newer distribution's repository (via sources.list) and dselect did the rest. I think

Re: dist-upgrade problem (was Re: /etc/modutils/0keep: line 9: keep: command not found)

Re: dist-upgrade problem (was Re: /etc/modutils/0keep: line 9: keep: command not found)

dist-upgrade is an apt-get specific thing, and I'm not exactly what it does, other than repeatedly break users' debian systems and thus prompt frequent problem reports here.

Nevertheless if you follow through with dselect then I think it will probably recover your system.

Marty,

should i be concerned about the following. i did this without pointing sources.list to the new repository.

```
loro@debian:~$ sudo apt-get dist-upgrade
