i have a small vps with only 64MB memory. i am trying to run a costume made PHP

well, assume i don't have enough money to buy a better server. it is possible to make a very fast server with compiling the source code etc..

thank you

i use debian etch.

I find on my boxes with 64 MB ram or less, that I hit swap often. Etch is like that. So for old boxes, I run OpenBSD. No re-compiling necessary.

Doug.
