My booting of Etch was being slowed by /etc/network/if-up.d/avahi-daemon, so I removed execute permissions from that file, and now my boots are 10 seconds faster.

However, the avahi-daemon still starts. Will there be any adverse consequences to disabling .../avahi-daemon on my system?

I'm a dialup user, and I assigned a static IP address to eth0, so I'm hoping I don't need the avahi-daemon at all. (However, I'm not to clear on what it does.)

I don't have it installed at all. Then again, I don't use gnome. I just checked aptitude and some pice of gnome depends on avahi-daemon. Check on your system and see what's keeping it installed.

If gnome requires it, to me that would be another reason not to use gnome.

Doug.
