This second produced a null output. And following up on that hint, and with the help of `/usr/share/doc/tex-common/TeX-on-Debian.txt`, I was able to create `10local.cfg` in `/etc/texmf/updmap.d/` with:

Map pmn.map

This basically solved the problem. `xdvi` and `dvips` behave correctly and I can view and print the documents as I'd like to be able to.

The exception seems to be `ghostview`—it displays and prints a series of boxes where the glyphs ought to be. And `pdflatex` doesn't quite work (there are ligatures, like `th`, that it can't find, also some accented characters).

But these are details, and mostly the problem is solved, and I'm grateful for your help,

There might be a problem with `pdftex.map`. Look at the output of

`kpsewhich pdftex.map`

and check if this files contains all of your custom fonts.
