

USB devices not detected unless plugged in at boot

Source: <http://linux.derkeiler.com/Mailing-Lists/Debian/2008-09/msg00419.html>

On my Lenny system, USB devices (mouse, external drive, etc.) are only detected on boot. If plugged in after boot time, or removed and replugged, they are not detected and cannot be used.

I have udev installed. I even reinstalled it without success. I miss the old hotplug, which always worked perfectly for me, which I can't say about udev.

Any suggestions?
