I've searched through the list archives and have been unable to find anything that can shed some light on this issue for me. I have a base fedora install that once a week when the log rotate happens runs out of memory for some reason. The only package not in the fedora install I have on the system currently is Dans Guardian.

System has 192 MB of ram and 256 mb of swap.

If I manually run the log rotate everything works fine, there must be something else happening that I don't realize that is causing the memory problems. I'm fresh out of ideas so any suggestions would be greatly appreciated.

Tim
