Hi.

We are in the process of moving from RedHat 9 to Fedora Core 2.

When doing "Xorg –confirm", we get the following stanza:

Section "Monitor"

```
#DisplaySize 320 240 # mm
Identifier "Monitor0"
VendorName "DEL"
ModelName "DELL P793"
HorizSync 1129329536.0 – 0.0
HorizSync 30.0 – 96.0
VertRefresh 842024000.0 – 0.0
Option "DPMS"
```

EndSection

(Yes, we are using a DELL P793 monitor.)

Not too surprisingly, X windows complained about the HorizSync and VertRefresh lines. I removed the first HorizSync line, and replaced the VertRefresh line with

```
VertRefresh 50 – 160
```

(These values were from the old XF86Config–4 file.)

X windows now starts up fine, and works fine. However, when one logs out from the X windows session, a box starts wandering around the screen, said box containing a msg complaining that the refresh rate was wrong. CTRL–ALT–F2 (etc.) did not switch me to a virtual console. CTRL–ALT–DEL did not reboot the machine. The only "fix" was to do a hard reboot.

So, does anybody have the proper values for the vertical refresh rate? Should this be reported as a bug, and (if so), to whom?

Thanks.
