Well the error message says that /dev/cdrom is already mounted, which means what it says :)

To unmount it, try first as root

```
umount /dev/cdrom
```

When issuing the command, take care that you're none of your shells is in /mnt/cdrom, and that nautilus or konq or whatever does not have anything under /mnt/cdrom open, or you will get a device busy error.

After you unmount /dev/cdrom you can try the line you originally tried.

Tip: you can always check what's mounted and where by running

```
mount
```

without parameters.

Greetings,

//Andro
