

Fedora development: scp has really slow transfer speed

I just installed Fedora Development on a server that was running Fedora Core 3 until this afternoon. Now I am trying to copy my backup data onto the box, with scp and I realise that the transfer speed is close to DSL speeds – while I am on a LAN, with a 100Mbit connection to each mashine (and a GB fiber based backbone). :(

It is currently copying a 600 MB tar file at the tremendous speed of 82 kb/s, which will take a couple of hours... I have been doing these kind of scp and rsync operations all the time, and usually the transfer speeds are around 10–11 MB/s.

Anybody has an idea of what's going on?

Cheers,
Kenneth
