

SB Audigy not detected

To: For users of Fedora Core releases <fedora-list@redhat.com>

I have just purchased an Audigy 2 soundcard (this one: http://www.ebuyer.com/customer/products/index.html?product_uid=82109).

I have an Asus A7V333 motherboard which has onboard sound, but there is no way to disable the onboard sound in the BIOS (all the information I could find indicated that the onboard sound would be turned off automatically if there was a soundcard plugged in, but this doesn't seem to be the case).

Gnome doesn't detect the soundcard at all, it doesn't appear in any of the system tools and, even after I manually added entries to `modprobe.conf` I am still stuck with only my onboard soundcard. The `snd_emu10k1` module is getting loaded, it appears when I `lsmod`, but no sound card device is created.

It does seem that the kernel knows the card is there, it just doesn't seem to know what it is:

```
#/sbin/lspci | grep Creative
00:0e.0 Multimedia audio controller: Creative Labs: Unknown device 0008
```

```
#/usr/sbin/kudzu -p --class=AUDIO
class: AUDIO
bus: PCI
detached: 0
driver: unknown
desc: "Creative Labs: Unknown device 0008"
vendorId: 1102
deviceId: 0008
subVendorId: 1102
subDeviceId: 1001
pciType: 1
pcidom: 0
pcibus: 0
pcidev: e
pcifn: 0
-
class: AUDIO
```

Fedora: SB Audigy not detected

bus: PCI
detached: 0
driver: snd-cmipci
desc: "C-Media Electronics Inc CM8738"
vendorId: 13f6
deviceId: 0111
subVendorId: 1043
subDeviceId: 80e2
pciType: 1
pcidom: 0
pcibus: 0
pcidev: 5
pcifn: 0

So I'm thinking there will be a config file somewhere where I can explain that the snd_emu10k1 is the driver for deviceid 0008? Does anyone know where that is – or am I barking up the wrong tree. (BTW – currently running 2.6.10-1.770_FC3 because I couldn't get fglrx to work with the 2.6.11 kernel).

Rob
