

mail confusion

I'm using smartd to monitor my HD, and want it to send an email message to another address if an error occurs. I've specified the non-local recipient in smartd.conf correctly. Problem is that when mail sends the message, it sends it as being from "root@localhost.localdomain" – which of course is rejected as invalid at the receiving host.

How do I get mail to use my *real* address?

Thanks
