Hi all!

I apologize for this off-topic question. I have a FC4 (x86\_64) system running on an Asus k8n motherboard. So far, everything about this motherboard is *\*perfect\** for what I am looking for in a small home server. Thing is, I would rather not put a PCI or AGP video card into this machine if I don't have to. Does anyone know how to configure this board to boot completely "headless" ..? Ideally, I will be running getty on the serial port for those rare occasions that I need console access.

Any help would be appreciated, as I have searched google and Asus' website with little luck so far.

Thanks in advance!
