My ThinkPad (T20) does not shutdown properly.  
I'm told that this is because I am polling the temperature  
(with cpufreq), and also the battery.

Actually, I would rather have the battery and temperature info  
than shutdown properly, so I regard it as a price I have to pay.  
(It does not seem to have any bad consequences,  
since the hard disk does stop.)

But is there any way round this?  
Has it been notified as a bug, and if so of what?  
(I couldn't find it after a brief search.)
