hi...

further research hasn't solved the issue.

i have the server nfs
/etc/exports
/college 192.168.1.*(rw)

i have the client nfs/mount
mount -o rw 192.168.1.52:/college /college

when i add a file to the share as client1, the client and the nfs server can edit the file with no problem. the other clients can't!! in fact, the file attributes are changed/set to some very large number...

You must be doing something wrong since we do this all the time. Note:

- 1, Do you mean the owner is a large number = -2 == nobody. That is a problem since that will affect accessing the file.
2. You have nfs and nfslock initscripts running on the server.
3. The mounting should be done via a fstab as type nfs.

Maybe posting you exports file and fstab would help.

if i go to the nfs server, and i make the changes to the file (chmod, chgrp, chown) then the settings are somewhat seen by the other clients, and each client can then edit the given files on the nfs share...

i would have thought that there should be a way to set up the nfs, so that client1 can create/add a file, and that client2 can edit the file, and vice versa....

searching via google seems to indicate that this should work, but i can't see how to get it to perform.

thanks

RE: nfs questions!!!

ps. yeah, there are read/write privs on the nfs mount for the clients
and yeah, the user is the same on each machine

Subject: Re: nfs questions!!!

Do you have a user with the same name and password on both hosts?
Does said user have write permissions on the directory?
Is this root? Then you need a change to your exports line.

/video 10.10.10.0/24(rw,no_root_squash)

That is the line I use for my mythbox.
