Hi,

I am using Fedora Core 3.

Recently I have noticed that there are about 12 to 15 mysql processes running on my server. Is there a way to limit these processes? I have limited my httpd to 4 processes but I do not know how to limit the mysqld processes? All of the mysqld process are using 4.5% of the RAM so needless to say it is eating up alot of my ram...

Any help would be great...

Thanks. --
