I don't know if this will be of any help, but I have a Dell Precision \*M60\* running FC5 and as long as I use the open source nv display driver and \*not\* Nvidia's proprietary driver, I am able to suspend to memory.

If so I'd like to hear from you.

I will shortly be installing FC5 on my M70 which I have not been able to effectively use because of lack of Suspend.

I don't care if it is "to disk" or "to memory". As long as I can put the thing to sleep (with X running) and come back and have all the many things I had going on still going on, I'll be happy.

Thanks for your responses.
