: I don't know if this will be of any help, but I have a Dell Precision  
: \*M60\* running FC5 and as long as I use the open source nv display  
: driver and \*not\* Nvidia's proprietary driver, I am able to suspend to  
: memory.

I think I knew this back last time I was checking up on suspend (running Mandrake) in November. But I had forgotten. Anyway, there are some "issues" with the M70 that make it a different situation from the M60, but I don't remember the details.

But thanks for responding.

Dean
