No message, but I never use kopete, so there is no setup.

You are going to have to run something to use with the webcam, and whatever you choose you will need to run some setup or config option, or how will it find your camera? When I had problems I did find that running the various video apps from a terminal brought me some clues.

I ran camstream, xawtv, spcaview, spcagui and others but all failed because they didn't find /dev/video*

right, but did you use the right package yet? spca won't work. Ric
