What's the actual error message? It could be a name resolution issue, if one thing works and others don't.

I ran Wireshark and compared the output of my Windows box vs Linux box connecting to the online banking site. In both cases I see the Client side Hello, Server side Hello, Certificate, and Key exchange, encrypted handshake, etc. All seems to work pretty much the same on both sides (remembering that both are connected to a hub so I was able to do all my sniffing from the same environment – my Linux box). But the Linux side just hangs with "Loading..." and "Waiting for www1.banking\_url.com".

Makes me wonder if it's a browser setting...

So I try Konqueror – same thing. The status bar at the bottom has "Retrieving 26.8 KB from www1.banking\_url.com" and nothing else. Also hangs...

The usual suspects are javascript, flash, activeX. I'd start by checking javascript settings. Oh yes, and some such sites need popups available.

Anne
