Set the ISO's up in a NFS share on the remote machine and make sure that the proposed address for the new machine has access to that NFS share. Burn the boot.iso image that's on Fedora CD 1 to a CD, boot from that CD and tell it that you want to install from a NFS share when it asks you where to find the files.

That's all there is to it.

Thanks. Do the ISO names have to be specific? I assume the install is looking for particular ISO names?

Thanks.
