I'm looking to find a commandline driven torrent downloader I can run on my headless guiless server. I know that azureus allows you to drop torrent files in a directory and it will automatically start the session up and get things moving, but I was wondering if there is a similar way to do it with a commandline way? I'd like to automatically seed back so my share ratio is 1:1 and then delete the torrentfile and stop seeding, since my isp would have a heart attack because I don't have unlimited bandwidth.

Thanks.

ctorrent – found out about it at <irc://freenode/fedora> , best thing yet... better than the official bittorrent client IMHO
