Well, it depends on the user.. if for example you'll be assigning someone to a position that he/she is not used to do.. then most likely he/she may not do the work properly... but again... read.. read... read... will do the trick in most cases.. :)

Hi,

(note: this message may have occurred earlier, while I have not seen it on the list)

I hope to be excused as it was very complicated to figure out the Fedora jungle of where to ask or suggest anything.

Microsoft:

When it crashes, you insert the software CD, and somehow you will get going again.

Fedora&RedHat:

When it crashes, you insert the software CD, but instead of the situation above, most of your work is lost !

True/False ?

I suggest that the installation WILL have an OPTION for installing the X-server. It can be on the rescue disk, for instance.

If anyone has a good tip as how to reinstall X in

Re: Why most run Microsoft, not RedHat

Fedora6,
I sure would like to know and hopefully rescue my
disk.
But frankly, I don't understand why such an option
isn't
there in the first place.

//ARNE

BTW – it was the Add/Remove software packaged that
failed, it should only remove some graphical package,
but surprisingly removed the X-server as well.
(did look like it rolled back the dependencies..)
