Seems like the KDE developers had a collective brain fart and time for yet another bugzilla, huh?

I'm investigating alternative email programs – it is too critical to have this messed up. The other bugs recently introduced while slightly ugly don't impact my day to day work flow – mail does!!

Till now kmail was only braindead in the way it handled replies to (html) formatted mail (for which I am using evolution or thunderbird now ...). For other things I mostly preferred kmail I wonder if I can use fetchmail to grab from exchange – feed through procmail but deliver to local imap folders ... hmm anyone?

evo used to be quite slow with filters – i'll investigate again – its been a while – i'd prefer to use procmail but not sure a clean way to engage that with exchange.

I'm trying to make my mail as independent of the mail client as possible – for example I never save to local files – I run a local imap server and save all to that. Now I can access that with any mail client ... this is how I use evo or thunderbird when I have to reply to formatted mail (a good chunk of my corporate/business emails) – as kmail eats those!!
