Hi;

Does anybody know of or have a good little gui program, script, or command line program for printing 'info' pages. Up to now I have been using emacs + info, or cut and paste then print, or lpr -node.

I want something slightly more sophisticated. Print several related nodes, a whole node tree with some nodes excluded, etc.

Have googled and sourceforged. Maybe I am not using the correct search criteria ("Info print" and variations)?
