I am looking for a couple of packages for edns. These are the packages I need are they installed by default if not what are the actual names of the packages? I am unsure which ones to get.

use MIME::Base64;
use IO::Socket;

Here's a nice way you can find perl packages based on the module name (the name used in the 'use' statement):

```
yum whatprovides 'perl(IO::Socket)'
```

Both of these modules happen to be in the main perl package, which is installed by default.
