I have a ThinkPad T60 running F7. After the recent kernel update, suspend to RAM no longer works. It drops to text mode, says it is suspending, and locks up.

Try playing with one of the `pm-suspend` settings. See `pm-suspend --help` for the possibilities. Open a terminal and as root and try for example:

```
# pm-suspend --quirk-s3-mode
or
# pm-suspend --quirk-s3-bios
or
# pm-suspend --quirk-s3-mode --quirk-s3-bios
```

My laptop (Acer TM6460) needs the first one to properly suspend.

Also have a look on this webpage:

<http://people.freedesktop.org/~hughsient/quirk/quirk-suspend-advanced.html>

You may need to create that `unload_modules` file in `/etc/pm/config.d/` and add some modules like `iwl3945`, `kvmv`, `kvm_intel`.

I can't get the machine to respond at all with the keyboard, so I can't get to a console.

Is this common? Is there a work-around? (I kind of like suspend on a laptop.)

Dunno about common. My laptop suspended/resumed fine with FC6 but with F7 it's not resuming anymore. For a work-around try one of the examples I gave above.

Regards,
Patrick

Re: New hang on suspend, anyone?

The only one thing that occurs to me at the moment would be that you had a look at `gconf-editor > apps > gnome-power-manager`. There you could check some of the keys, using your common sense.

My laptop is a ThinkPad T42 and I must recognize that with F7, for the first time in the whole Fedora serie (since F3 maybe..?), `suspend to RAM` `_does_` work here out-of-the-box. Though, actually I don't use its method now either.

The reason is that I got used to some scripts that I obtained from <http://www.thinkwiki.org> and other places over there., this since FC4, they `_did_` work easily, therefore I put them into each Fedora release I install here.

Since you own a ThinkPad, `_maybe_` you are interested in to have a look at the above place. I suppose you're using the F7 built-in `suspend-to-ram`.

Daniel
