it only works with Xen Kernel (2.6.20-2925.13.fc7xen)and, I can't use my videocard acceleration, no desktop effects and so on ! Also sometimes, I have sound at one speaker and, eventually, at both ! When I try to boot with " normal " kernel (2.6.22.1-41.fc7) , hangs at starting firewall or, when looking for hardware ! Is there a way to solve this situation ?

It might be worth trying the current f7 kernel-2.6.22.4-65.fc7 ?

You could try disabling the services you mentioned {temporarily}. If you start in runlevel 1 {append "1" to the grub kernel line},

```
chkconfig --level 35 iptables off
```

```
chkconfig --level 35 kudzu off
```

It would be helpful to remove the rhgb and quiet options to see if any additional information is printed before the hang.
