php-mysql-5.2.4-1.fc7
[root@v234 named]#
```

Could someone fix that?

Where did you get the PHP 5.2.4 update? In [updates-testing]? I cannot find it in any of the repositories and not in the Fedora Updates System either. Which repos do you use? The 5.2.4-1.fc7 build of PHP in koji (= the Fedora 7 Build System) contains also a newer php-gd package which requires php-common = 5.2.4-1.fc7 whereas in your update attempt yum complains about the old php-gd package from stock Fedora 7.

Anyway, such a problem has not been found by the broken deps checker either, which is run regularly for Fedora 7, too, and reports problems to the package maintainers. Hence I believe there has never been an official Fedora 7 Update for the prepared PHP 5.2.4 build yet.

Re: php-gd dependency problem

<http://bugzilla.redhat.com> -- Product "Fedora", Component "php" --
would be the place where to report bugs with the packages.
