I'm planning on getting a home server,
serving httpd, ssh, mysql, dovecot, etc,
and running Fedora 7.

I'd like something using as little energy as possible,
given that I need 200-300GB in disk-space.
But I don't need a monitor (or graphics card).

Is anyone running such a system?
If so, I'd be interested to hear the hardware details.

I have 3 shuttle SFF (small form factor) systems and a Macintosh on a
single 4 port KVM switch.

The Shuttle SFF only allows 1 hard drive and 1 CD (or I suppose you
could use a second hard drive instead of CD) but drives are available up
to 750 Gb now (perhaps higher but I haven't seen one).

If I go to www.shuttle.com, it automatically takes me to their US site -
YMMV
