Is it just me or does kernel 2.6.26.3–29.fc9.i686 not give a graphical boot?

Something related here, I think – with 2.6.26.3–14 the kernel wouldn't even boot with vga=804 parameter – just stayed on blank screen right after BIOS. Somehow, pressing the power button would bring it out of the deadlock and it would start booting.

This morning I've booted to the previous version that worked fine – 2.6.25.14–69 and did a yum update to 2.6.26.5–28. Everything works fine now
