Hi guys,

A new way of showing/hiding individual toolbars was introduced in this release cycle of Epiphany. We've found that the UI for this still has some rough edges that we would like to polish, but because we're in UI and string freeze, the release and i18n teams have requested that we get an UI review this Monday to approve of the changes.

The full rationale behind this request can be found in this thread:

<http://mail.gnome.org/archives/gnome-i18n/2006-February/msg00220.html>

The patch, along with before/after screenshots is available here:

<http://home.exetel.com.au/harvey/epiphany/toolbar/>

We're hoping that the UI team will agree that these changes, or at least some of them, are worthwhile.

Both the before and after versions of the View -> Toolbars menu are inconsistent.

If a 'Show...' item has a tick, then it's something that is currently visible, and I untick to hide it.

Re: [Usability] Requesting mini-UI review for Epiphany toolbar patch

Re: [Usability] Requesting mini–UI review for Epiphany toolbar patch

When it's hidden, the tick is gone and the menu item text is the same, 'Show....'.

But the main control (the after version) seems to be a menu toggle, where if it's hidden the text reads 'Show...' and if it's visible, the text reads 'Hide...!'

You're mixing two types of menu control here. I would put 'Show Toolbars' at the top of the submenu, and when it is unticked, grey out the individual items beneath it but keep their ticks.
