I followed the instructions on this tutorial: <http://www.linuxplanet.com/linuxplanet/tutorials/6223/1/> which shows how to configure gnome to look a lot like OSX. It works very well and I'm awfully pleased with it.

However, for some reason when I add the volume control applet to my top panel it doesn't show up. At first I thought some kind of app problem was to blame, but when I click around very carefully, I find that the applet is actually there and running. It's icon must be one pixel wide and perhaps colored the same as the underlying panel (??).

I'd like to do whatever I need to to override this icon with something visible. Can anyone direct me on where to look to figure out what the volume control applet is currently using for its icon? And then how to replace it (I could always just put a different icon file in place, of course).

Thanks,
Rick
