I don't know what version of Gnome I have, but it's whatever is installed on my Ubuntu-64 Breezy computer, which has all the latest updates. (Planning on upgrading to Dapper after finals in a couple weeks.)

The Character Map utility default startup options suck. I am a linguistics major and I need to use it a lot. I need it to come up in View > By Unicode Block, and with the character displayed at 14 points instead of the default 20, and to automatically select my favorite IPA font, instead of the default Sans. I've searched everywhere looking for command-line options to make this happen, but documentation seems completely lacking on this. It is highly annoying to have to reconfigure it every time I launch it. Anyone know what the options are, or even if there are options, or where there is documentation explaining the options? Or if said options do not exist, then is there a Character Map replacement that does what I need?
