Hi all. I'm running a GNU/Linux (Debian) system with GNOME 2.14.3 (I just love the exquisite look, functionality and feel of the desktop BTW! I find I can get everything done easily and efficiently.)

I have a short question: When I log in, GNOME starts the windows which I did not close in the previous session. My question is: Does anyone know any way to have these windows "preserve" their minimized state so that when the new session starts they are minimized? Sometimes the new windows sort of "clutter" my desktop and it'd be nice if I can start them minimized. Really appreciate any help! Thanks!
