Gnome knowers:

I'm trying to port a GUI application from old libraries (GTK and Gnome) and an older version of glade to new libraries and glade 2. A former colleague wrote the original code and made use of GnomeLess to display the contents of periodically updated text files to a couple windows in the GUI.

I see that GnomeLess was cut out of the modern libraries. Does anybody have a quick way to implement the functionality of GnomeLess with the new gtk and gnome libraries?

I've tried searching the web and usenet and haven't found any hints. I'm asking for help prior to trying to implement the GnomeLess functionality using GtkTextView and the like.

Thanks,

Chad
