Refer to section 5.2.3 of the docs for information about configuring XDMCP:

<http://www.gnome.org/projects/gdm/docs/2.16/configuration.html>

Note Enable=false by default, so you need to turn it on if you want it to work. You can also configure by running gdmsetup as root and change the XDMCP settings there.

Brian

The following doesn't exit at all on previous version, on sarge (debian) I used last year, but it on the current version etch (debian).

the problem is:

I have a serveur running the standard etch (debian) with gnome, I configured the Login window and check (activate) the XDMCP. My server is not visible from a remote client.

Is there a new thing in gdm or gnome (or in debian ???) which can stop the Xdmcp protocol ??

I did same procedure on previous release, without problem!!!!

I don't know if it is a gnome problem (because I noticed same problem with Fedora 5) or debian problem.

thanks for help
best regards
bela
