Hi All.

I have a small problem:

1. I open workspace #1 and open (for-example, any application have the same behavior) browser there. In the panel in the bottom small window is appear. (See screenshot #1)
2. Then I switch to workspace #2 (using Hot Key) and open there some applicatoins. (See screenshot #2)
3. Then I switch back to workspace #1 where ONLY browser was opened, but here I see fashing window from workspace #2. (See screenshot #3).

I'm using 2.18 sid Gnome edition. My panel has options "Never Group Windows".

Does anybody know how to resolve such problem and what does flashing window mean?

The "window list" panel applet has an option to either show

- * windows from current workspace
- * windows from all workspaces

Sounds like you have the latter set.

To change it right click on the think vertical bar to the left of the leftmost listed window (for screenshot 1 it is to the left of mozilla-firefox) and select preferences.

I believe the flashing indicates that some activity has occurred in that window, but I am not sure.
