Hi,

After a system update, I'm left in a state where my application menu is empty and where the system menu do not show the system preference tools.

Moreover, all icons on my systems are the default ugly icons (as if `gnome-settings-manager` wasn't there. But it is here).

I tested it with non gnome applications like `thunar`. Applications like the menu editor tells me that the menu is empty ...

I tried to start gnome with a fresh empty homedir to see if the problem was here, but even with this fresh profile, I couldn't have icons or my menu.

I reinstalled the menu package of my distribution (ArchLinux) but it didn't solved the problem.

I don't know exactly where to ask and I thought this could be a place for that. If it is not please tell me.

Do you have any idea what the problem is ?

Thanks

Mildred
