thank you so much for the prompt attention –

the issue has been resolved with the new open office release, 2.3.1.

I sincerely appreciate the reply, and hope not to have inconvenienced anyone.

best wishes,

martin

If I open a file on a different computer on the network, the file opens, and the drop down box where it should say "default" or whatever reads "preformatted text" and there is no content.

So far, a pain. But, then, the file on the pc where it is located becomes empty, 0 kb, so, in essence, openoffice, or vfs, or open office gtk, or whatever, eats files on the network. Now, serious and urgent.

Sounds like an OpenOffice issue to me. Or maybe a distro/packager issue.

Since I am not a programmer, I cannot tell if the problem is OO, somewhere in the vfs mime id, or wherever. Funny enough, the 2.1 OO has no problems, unless I update the libgmime to 2.2.11-1, so I have a feeling the problem lies in the nautilus or gnome networking or mime

Re: dangerous openoffice behaviour

identification, but how, I have no clue.

GMime is totally unrelated. There is absolutely no way, updating libgmime could affect this at all. It is a library for creation and parsing of MIME messages (read: email).
