Daniel Kasak pisze:

Greetings.

I often get called to PCs that have 20 or so instances of Evolution, Firefox & internal applications running. People clearly don't understand the difference between an application launcher, and an application's icon in the taskbar.

Possibly, a solution for this exists in Gnome. With startup notification, we should be able to link an app's launcher with a running instance of an app, right? So could there be an option to make app launchers launch **only** one instance, and all further clicks on the launcher bring this instance into view, instead of launcher more apps?

I agree, anybody else ?

Irens
