Hello Everyone:

I've a user of GNOME, I wonder that why the cpu performance value to use when on AC power is 85 by default?

I found the settings in Configuration Editor,

/apps/gnome-power-manager/cpufreq/performance_ac is set to 85 by default.

Someone set the value to 100, the performance is up, and someone have no effect.

I want to know why.

Thanks.

TualatriX
