Hello,

I'm using Debian Lenny together with Gnome 2.22.0.

I'm looking for a way to modify the "places" menu, since I added some remote locations to my "Network Places" with wrong access parameters, and I want to delete them.

In the docs I've found a pretty good explanation about the "Applications" menu, <http://library.gnome.org/admin/system-admin-guide/stable/menustructure-0.html.en> but nothing about the files that rule the "places" menu.

It seems also that the "Network Places" have anything to do with the Nautilus bookmarks. (somebody suggested me to modify the Nautilus bookmarks to affect the "places" menu...)

Hi,

In GNOME 2.20, the network places are handled through gconf, in /desktop/gnome/connected_servers/ to be precise. You can use gconf-editor or gconftool to edit these.

If you simply want to delete them, unmounting them from the desktop or from nautilus and re-adding them should work.

In 2.22, network locations are handled as gtk bookmarks, in ~/.gtk-bookmarks
