I upgraded to KDE 3.5.2 this weekend. Since I did, Konqueror seems unable to log in to certain portal pages, Yahoo and Google, for instance. When I try Yahoo, I get:

An error occurred while loading
https://login.yahoo.com/config/login_verify2?: The process for the
<https://login.yahoo.com> protocol died unexpectedly.

When I try Google, I get:

An error occurred while loading <http://google.com/ig>:
The process for the <https://www.google.com> protocol died unexpectedly.

Does anybody have an idea as to what is causing this? I got Slackware 10.2 packages directly from the KDE download site. In KDE 3.5.2 all of this worked fine. But those packages were compiled from source. I can always compile again, but I was hoping the packages would just work.

Well, I have another clue. I can't log in to any secure site and Kcontrol just crashes if I open it and go to the security module. So, crypto is just broken in these packages. Maybe they're built against an incompatible version of OpenSSL or something.
