I am not quite sure what you are saying here, but if you send a mail while in that particular mailing list environment, it changes your "identity" automatically so it is sent with the proper identity and will not bounce.

I don't know what it means to be in a "mailing list environment".

Being in the mail folder that holds a mailing list.

Do you have Kmail filtering the mailing list traffic to a specific folder? And have you specified that folder as containing a mailing list? Ex: I have a KDElist folder and any mail coming in with the kde@xxxxxxxxxxxx header gets put into that folder where I can read it, reply to it etc. and K mail knows to supply the correct identity, address, and subject (in the case of a reply) when I send it. This is quick and easy. K mail fills in the header for you. No other intervention needed.

If you just send a brand new message in general, and put in the mailing list address, click on the identity drop down list and make sure the proper subscribed "identity" is sending it.

I understand how I *can* do it. I suggesting an improvement. The way mailing lists tend to operate, all mail to the list should come from one email (identity). It should not matter how I create the email, or what 'environment' it should come from that email.

Kmail has no way of knowing what your intentions may be. If you have several mailing lists subscribed to by different "identities" and you are in that folder then kmail knows what identity should send it. Even if all of your

Re: [kde] kmail – sending profile preference

mail lists are subscribed to by the same person that would still hold true. If it is not done automatically through that method then you must choose which identity should send it. If all of your mail is to and from lists make that sender "identity" the default one.

Really hope this helps.

Bob S.
