I'm not an SBC user, but it looks good, but I would try a few diff Authentication methods—see, if that makes a diff. Also, is Thunderbird remembering the password? By chance, did you enter it wrong and then correct it later?

Have you tried removing the account and creating it all over again?

Any other mail programs setup and working? Is Port 110 actually open thru the firewall? Have you checked the runlevel services and mail-related services in there?

Almost certainly, this is a configuration problem.

Good luck with it—I know how aggravating it can get.

I was a customer of SBC Yahoo (now ATT Yahoo) until about two months ago. I did not use my POP3 mailbox with them except to receive mail related to the service and I used Fetchmail to retrieve it. I did not need to set up any special authentication. The only problem I had was sending mail through their server (they block outgoing port 25) from Postfix and it took some time to figure out how to do that.

Hi Robert,

Here are my settings:

Receiving:

Account name: user

Login: user@xxxxxxxxxxxxxx

Password: xxxxx

Host: pop.sbcglobal.yahoo.com

Re: [kde-linux] kmail – receiving mail with sbcglobal yahoo

Port: 110
Extras:
Encryption: None
Authentication Method: Clear text

Sending:
Name: sbcglobal
Host: smtp.sbcglobal.yahoo.com
Port: 25
Server requires authentication: Yes
user@xxxxxxxxxxxxxx
Password: xxxxx
Security:
Encryption: None
Authentication Method: Plain

The send side work great. But the receive doesn't work.

Regards,
Dan

Hi Robert,

I did specify user@xxxxxxxxxxxxxx At
least I know somebody has got
it work. I called tech support, but if your not
using Outlook they will
not help you. Looks like I'll have to try this
on a windows system.

Thanks,
Dan

Greetings,

I setup a
new
installation
for a friend
today using
DSL
sbcglobal.yahoo.com

Re: [kde-linux] kmail – receiving mail with sbcglobal yahoo

I have no
trouble
sending
email
through the
SMTP
server at
sbcglobal.yahoo.com
however I
can not
receive
email. It
keeps
saying the
username/password
is invalid
which
seems
strange
because I
send email.
Is there
anybody
that has
configured
DSL
pop.sbcglobal.yahoo.com
and got it to
work?
BTW:
There are
two email
accounts
which give
different
errors, the
main
account
says "Server
is busy try
again later",
the other
account
says
username/password
is
invalid.

Regards,
Dan

user name is the full email address for both the pop and smtp servers:
user@xxxxxxxxxxxxxxxx I've used kmail, evolution and (currently) Thunderbird with no problem...

Robert

how do you have the servers configured? Here's mine (Thunderbird):
pop.sbcglobal.yahoo.com port 110 use secure connection: 'no' checked
smtp.sbcglobal.yahoo.com port 25 use secure connection: 'no' checked

Re: [kde-linux] kmail – receiving mail with sbcglobal yahoo

I just set up kmail with the above settings (no choice on ports though), and after a little while at the "checking security capabilities of sbcglobal.net" window, I was able to just start downloading my mail.

I tried to send a test message to myself, and had to modify the account settings and add my user name and password, then all went well.
