Hi Dale,

Windows handles email perfectly with pictures and the ability to edit your HTML email with the ability to cut and paste HTML email without losing the formatting. This is one of reasons I still have a Windows computer besides my Linux computer.

All the best,
Dan

When I forward an email which includes embedded images in the text, they are removed and the only reference to them is at the end of the email. Is there anyway I can forward email leaving the images in the correct place as per the original email.

Bob

Seeing that email was not intended for that type of use. Try making a pdf of it and sending it that way. It is just a poor idea to include images in ones email, not to say that many folks will set their clients to not display images anyway.

Re: [kde-linux] Forwarding mail using kmail

I would also send the same email to several other people and see how they see it when they open it. It could be that it is not the way you are sending it but the way the person getting the email has it set up to open on their end. Example, they may have it set not to open anything attached which could include your pictures.

This may not be something you are doing, it may be them. If you would like, send the email to me and I will tell you what I see or send you a screen shot of it.

Dale
