I'm not subscribed to the linux-kernel list, I would appreciate a CC on any replies, but I will be watching the list as well.

I am using kernel 2.4.24 on a heavily-used NFS server. I am receiving hundreds of messages like:

"kernel: fh_verify: no root_squashed access at sessions/lastsession."

in my messages log, usually accompanied by a "last message repeated 6497 times" a minute or so later. I'm gathering it is just reporting it is denying root access to a share, which is fine and exactly what I asked for. Is there anyway to shut this logging off without just wiping the line from fs/nfsd/nfsfh.c? I really can't afford to be rebooting the box to install a new kernel right now. I've searched google, linux-kernel, and other resources, and while I've found others with the same problem, no solutions have been posted.
