Hi Jesse,

as shown below, that is not one of the options presented to me in my 'disk' file

```
% cat /sys/power/disk
shutdown
```

My machine can only use the shutdown keyword – which worked in -rc3.

Mitch

> *Basically the suspend process appears to start but the machine is never powered off and the resume kernel routines are run immediately bringing the kernel/system back to it's resumed state. The *same* kernel config works on -rc2. If i hard power off the machine then i have to fsck my disks on bootup (as expected) and the suspended image is not loaded.*

> *Clearly the latest patches have broken something but what ? Can anyone else without ACPI suspend on -rc3 ?*

It's working for me on my Thinkpad 600x (ACPI is not compiled in) Used

Linux-Kernel: Re: 2.6.9-rc3 software suspend (pmdisk) stopped working

'reboot' command from Documentation.power/swsusp.txt

Jesse
