Hi everyone!

I hope you had an nice and relaxing x-mas and are ready for a nice new years eve.

I just have a little question, i really dont if this has ben discussed before, but if it has im really sorry.

Why aint there any stack protectors such as PaX or something similar on the Linux kernel? Couldent it be an idea for the Linux Development Team to create something that will protect against the most known attacks? Im not talking about preventling everything because thats impossible and there will always be some way to trick these protectors. But remove most of the "attacks".

//David
