The help text says that if you select CONFIG_LBD, then it will automatically select CONFIG_LFS. Nope... That isn't currently the case.

I'm not sure your patch makes anything much better, though.

Why does CONFIG_LSF exist in the first place? Afaik, it only affects a totally not-very-interesting thing (blkcnt_t) for a totally not very interesting feature (the number of people who want single files >2TB is likely not very big).

Having it auto-selected by LBD sounds insane, since LBD is likely more interesting than LSF itself is. It would make more sense to go the other way (have LSF auto-select LBD).
